— DIRECT ANSWER

A complete UKG implementation quote connects price to the workforce outcomes, product scope, delivery team, responsibilities, deliverables, client effort, assumptions, exclusions, change rules, and post-go-live coverage. A total fee without that context is not a comparable quote. It is a number attached to an incomplete risk picture.

UKG implementation guidance emphasizes scope, timelines, budgets, responsibilities, stakeholder engagement, training, data integrity, risk management, measurement, and continuous improvement. Those elements should be visible in the proposal and tied to the operating work the platform must support. If they are absent, the uncertainty has moved to the buyer.

Flyvbjerg and Budzier put a number on that uncertainty. Across 1,471 IT projects they measured an average cost overrun of 27 percent, but one in six projects overran cost by roughly 200 percent and schedule by about 70 percent. Normalizing scope is how a buyer avoids pricing that tail by accident.

— QUICK QUOTE CHECKLIST

- Exact UKG products, modules, populations, and geographies.
- Named partner team and expected allocation.
- Vendor, partner, client, and third-party responsibilities.
- Discovery, design, configuration, data, integration, testing, and training deliverables.
- Timeline, milestones, dependencies, and decision deadlines.
- Cutover, hypercare, documentation, and support transition.
- Pricing model, invoice triggers, expenses, rate card, and change control.
- Assumptions, exclusions, acceptance criteria, and client effort.

How industry context changes the UKG quote

The proposal should show how the delivery plan changes when the workforce environment changes. Ask each bidder to connect sector-specific complexity to named deliverables, acceptance evidence, client effort, and price.

OPERATING ENVIRONMENT	EVIDENCE THE PARTNER OR PLAN SHOULD ADDRESS
Healthcare	Include credentials, coverage, facility and unit rules, differentials, access, clinical stakeholder testing, and the time-to-pay handoff.
Manufacturing	Include skills and certifications, plants and lines, shift rules, labor agreements, jobs and transfers, supervisor testing, and production labor reporting.
Retail & Hospitality	Include location demand, worker groups, seasonal volume where relevant, transfers, premiums, manager workflows, training scale, and cross-location reporting.
Services & Distribution	Include mobile, route, warehouse, and branch workflows, travel and overtime rules, distributed approvals, exception handling, and delivery-oriented reporting.
Public Sector	Include collective bargaining agreements, civil-service or union rules where applicable, complex schedules, budget and procurement controls, audit trails, accessibility and security requirements, public reporting, and continuity of essential services.

A proposal can use one delivery method across sectors, but it should not pretend the discovery, test data, stakeholders, or acceptance evidence are identical.

The 11 sections every UKG proposal should contain

1. Business context and outcomes

The proposal should state what the organization is trying to improve and which measures matter. Examples may include payroll control, scheduling consistency, manager self-service, data visibility, employee experience, or support capacity. Outcomes keep configuration decisions connected to business value.

Why it matters: Without agreed outcomes, teams can complete configuration tasks without proving that the implementation improves the operation or supports the business case.

2. UKG product and population scope

List the exact UKG products and modules, employee groups, legal entities, countries, pay groups, unions, business units, and deployment phases included. Avoid a generic phrase such as “UKG implementation” when the actual work differs materially by product and workforce.

Why it matters: Product and population details determine the real workload, dependencies, controls, testing effort, and price. They are the foundation of a comparable quote.

3. Delivery model and named team

Identify the roles, people, location, availability, allocation, and continuity plan. Clarify which work is performed by UKG, the implementation partner, another vendor, and the client. State how new resources are approved and how replacements transfer knowledge.

Why it matters: A buyer hires the proposed team, not a company logo. Named roles and allocations show whether the plan has enough experience and capacity to deliver the promised scope.

4. Discovery and design deliverables

Define workshops, requirements, future-state decisions, workflow designs, role and security models, integration designs, report inventories, and approval artifacts. The buyer should know what closes discovery and what becomes the baseline for build.

Why it matters: Discovery converts assumptions into approved decisions. Clear exit criteria prevent unresolved questions from being pushed into configuration, testing, or change requests.

5. Configuration scope

Name the modules, features, workflows, rules, reports, dashboards, notifications, and environments included. Specify revision limits, client assignments, and the line between included configuration and a change request.

Why it matters: Configuration language controls what the partner must build and what the client must supply. A precise boundary reduces disputes, rework, and surprise fees.

6. Data conversion

List source systems, history, extracts, cleanup, mapping, transformation, load cycles, reconciliation, exception handling, retention, and sign-off. Clarify whether data quality work is included, guided, or fully owned by the client.

Why it matters: Data quality and reconciliation directly affect payroll, reporting, employee trust, and launch readiness. Unassigned cleanup or validation work can delay the project even when configuration is complete.

7. Integrations and technical work

For each connection, define systems, fields, direction, trigger, frequency, method, security, error handling, testing, third-party dependency, monitoring, and steady-state owner. Separate an interface name from a complete integration scope.

Why it matters: An integration is an operating process, not a line item. Its ownership, failure handling, monitoring, and support model determine whether information continues to move correctly after launch.

8. Testing and readiness

State who develops scenarios and scripts, prepares data, executes tests, manages defects, performs retests, and signs off. Include payroll, time, scheduling, security, integration, reporting, manager, and employee scenarios relevant to the scope.

Why it matters: Testing is the evidence that the configured system works across real workflows. Defined owners and exit criteria prevent a calendar date from being mistaken for readiness.

9. Training and change

Define audiences, learning objectives, sessions, environments, job aids, recordings, editable source files, office hours, communications, and post-launch reinforcement. UKG's own guidance treats training and stakeholder engagement as critical implementation work.

Why it matters: A technically correct system can still fail if employees, managers, payroll, HR, and administrators cannot use it confidently. Training scope determines adoption and long-term ownership.

10. Cutover, hypercare, and transition

Document cutover tasks, go-live coverage, severity rules, triage cadence, response expectations, knowledge transfer, open-issue handling, documentation handoff, and the point where implementation ends and ongoing support begins.

Why it matters: The highest-risk handoffs occur near launch. A defined cutover and support transition protects payroll continuity, issue ownership, response expectations, and institutional knowledge.

11. Commercial and legal mechanics

Identify fixed-fee, time-and-materials, milestone, or blended pricing. Include rates, estimated hours, expenses, invoice schedule, taxes, payment terms, travel, budget alerts, change process, termination, transition assistance, and any third-party charges. Have appropriate legal and procurement owners review contractual terms.

Why it matters: Commercial mechanics determine how scope uncertainty becomes cost. Clear billing, change, termination, and transition terms let the buyer compare total exposure instead of comparing headline fees.

What changes a UKG implementation partner quote?

DRIVER	QUESTIONS THAT EXPOSE THE EFFORT
UKG product	Which products and modules are in scope, and which delivery roles are required?
Workforce	How many populations, pay groups, unions, schedules, locations, and jurisdictions are involved?
Data	How many sources, years, records, fields, and cleanup problems exist?
Payroll and WFM	Which rules, calculations, exceptions, approvals, and operating controls must be validated?
Integrations	How many systems, vendors, data flows, custom requirements, and failure paths exist?
Security and compliance	Which roles, sensitive populations, audits, controls, or regional rules apply?
Internal capacity	Who can decide, provide data, test, train, and support the system, and how much time is protected?
Deployment	Is the launch phased, parallel, regional, seasonal, or tied to a fixed event?
Support	How long are hypercare, stabilization, managed support, or optimization services required?

Do not ask a partner to price unknown complexity and then expect a firm number with no conditions. Good discovery improves commercial clarity.

A fair quote comparison normalizes workstreams, ownership, client effort, assumptions, exclusions, and transition coverage. Original Align HCM illustration.

How to compare UKG partner quotes fairly

- 1 Create one bid workbook.** Give every partner the same modules, populations, integrations, assumptions, timeline, and client-capacity facts.
- 2 Map every line to a workstream.** Compare discovery, configuration, data, integration, testing, training, cutover, support, and project management separately.
- 3 Normalize ownership.** Identify work included by one bidder but shifted to the client or UKG by another.
- 4 Value the named team.** Compare allocation, seniority, product fit, location, continuity, and access to specialists.
- 5 Estimate internal effort.** Convert client assignments into time from HR, payroll, IT, managers, testers, trainers, and sponsors.
- 6 Model one scope change.** Ask each bidder to price or explain the response to an added entity, integration, rule set, or deployment phase.
- 7 Price the transition.** Include hypercare, unresolved issues, documentation, knowledge transfer, and ongoing support.
- 8 Record confidence.** Mark each line as firm, estimated, allowance, optional, client-owned, vendor-owned, or excluded.

A side-by-side UKG proposal table

FIELD	PARTNER A	PARTNER B	PARTNER C
Exact UKG products and modules			
Populations and phases			
Named team and allocation			
Discovery and design outputs			
Data sources, loads, and reconciliation			
Integrations and third parties			
Test planning, execution, and retesting			
Training audiences and source materials			
Cutover and hypercare			
Client-side project leadership			
Assumptions and exclusions			
Change-control model			
Estimated internal client effort			
One-time fee and ongoing support			

The table makes omissions visible. It should not replace careful review of the full proposal and contract.

Comparing bids against one explicit criteria set, rather than weighing them holistically, is the approach the [software-package selection literature](#) recommends for exactly this reason.

Quote red flags

- The proposal does not identify the UKG product or modules precisely.
- “Standard implementation” is not defined.
- The delivery team is unnamed or can change without discussion.
- Data cleanup, integration failures, testing, training, or hypercare are assumed away.
- Fixed fees rely on broad exclusions.

- Time-and-materials work lacks budget reporting and approval controls.
- Client responsibilities are listed without capacity estimates.
- Acceptance criteria are missing.
- Post-go-live support begins under a new fee before implementation issues are clearly classified.

Ask Align HCM about UKG scope

Align HCM supports UKG services, HCM [implementation](#), [client-side project leadership](#), data, integrations, training, stabilization, and ongoing support.

If you are preparing an RFP, building a budget, or comparing proposals, [contact Align HCM](#) for a free, no-obligation assessment. Share non-confidential scope facts in the first inquiry. Use an approved secure channel for contracts, employee data, or sensitive project records.

Frequently asked questions

Q How much does a UKG implementation partner cost?

The cost depends on the UKG product, modules, workforce, data, integrations, payroll and WFM complexity, internal capacity, deployment model, training, and support scope. Request comparable proposals rather than relying on an unsupported universal estimate.

Q Is UKG software included in the partner quote?

Software and partner services may be contracted and billed separately. Ask every party to identify licensing, implementation, third-party, travel, integration, training, support, and ongoing costs so the budget has no hidden ownership assumptions.

Q Should a UKG implementation quote be fixed fee?

Fixed fee can work when scope, assumptions, deliverables, dependencies, and acceptance criteria are stable. Time-and-materials or blended models can fit uncertain work. The right model makes uncertainty and control visible.

Q What is usually excluded from a UKG implementation quote?

Exclusions vary. Common areas to examine include data cleanup, historical conversion, custom integrations, third-party fees, client-side project management, end-user training, travel, extended testing, out-of-hours cutover, and ongoing support. Treat only the actual proposal as authoritative.

Q Can Align HCM review our UKG implementation quote?

Align HCM offers assessment and client-side services that can help clarify scope, ownership, readiness, and proposal differences. Agree on the review scope first and share confidential documents only through an approved secure method.
