

GT AESTHETIC & FUNCTIONAL
MEDICINE

PREPARED BY MOMENTUM · 21 AUGUST
2026

The expertise is real. The **search footprint** **barely shows it.**

A current-state SEO, AI visibility, authority, and technical audit with the exact 90-day treatment plan to turn Dr. Farooqui's expertise into discoverable, citable patient answers.

The opportunity is not to manufacture authority. It is to make the authority already inside the clinic legible to Google, AI answer engines, and the people asking high-intent local questions.

EVIDENCE WINDOW

Semrush: US desktop, Aug. 20, 2026

Ahrefs public checker: Aug. 21, 2026

Technical sample: 6 priority templates

Owned analytics: pending access

A treatment plan for discoverability

-
1. Executive snapshot
 2. Verified assets and growth constraints
 3. Engagement context
 4. Demand and query mix
 5. AI visibility
 6. Authority and links
 7. Technical reality
 8. Business case
 9. 90-day treatment plan
 10. Learning system
 11. First work queue
 12. Measurement and governance
 13. Evidence and limits

This redesign preserves the audit evidence and sequence while sharpening the visual system around GT Clinic's navy, gold, and clinical identity.

GT is built like a credible practice, but discovered like a new website.

The live site already communicates breadth, physician leadership, and a differentiated blend of aesthetic and functional medicine. The missing layer is a connected search system: stronger technical delivery, tighter service and location intent, more independent authority, and a repeatable process that earns citations in AI-generated answers.

19 Semrush organic keywords ESTIMATE	2 AI mentions across tracked engines ESTIMATE	0 Google AI Overview mentions ESTIMATE	29 Local mobile Lighthouse performance score VERIFIED TEST
--	---	--	--

Repair the signal. Publish the proof. **Earn the citation. Iterate.**

What GT already has is strong. What machines can see is still incomplete.

VERIFIED ON SITE

What GT already has

- Triple board-certified physician leadership and 20+ years of experience, as presented by the clinic
- A distinctive aesthetic plus functional medicine positioning
- A solid homepage schema graph linking the practice and Dr. Farooqui
- Service and nearby-location pages with usable canonical tags
- An early ranking win for “dermal fillers Marlton”

GROWTH CONSTRAINT

What machines still cannot see clearly

- A broad, authoritative answer library around patient questions
- Enough independent citations to support category leadership
- Consistent first-page ownership beyond one or two service terms
- Fast mobile delivery at the moment of high-intent research
- A defensible presence in Google AI Overviews, Gemini, and category prompts

Our conclusion

Do not begin with a high-volume blog calendar. Begin with the physician entity, the highest-value service and location pages, the mobile experience, and the exact questions patients ask before they book. Then publish only what adds first-hand expertise, clinical review, and a citation-worthy answer.

The audit answers the decision behind the upcoming SEO conversation.

The recoverable proposal context points to a combined search, AI optimization, and paid-media conversation. The GT notetaker was not admitted to the meeting, so there is no transcript to quote. Rather than inventing notes, this report prepares the tangible pre-engagement materials that conversation requires.

PREPARED

Current-state audit

Organic footprint, AI visibility, authority, technical templates, mobile delivery, and local competitive evidence.

PREPARED

90-day operating plan

Sequenced interventions with owners, validation gates, dependencies, and an iterative AI optimization loop.

ONBOARDING GATE

Measurement handoff

Exact access list for Search Console, GA4, Business Profile, booking, call tracking, and CRM so estimates can be replaced with owned outcomes.

OPERATING PRINCIPLE

Precision, not volume

Every sprint closes with proof: what changed, what moved, what did not, and what we test next.

The sales promise should be **precision**, not volume.

One local service is breaking through. The rest of the footprint is thin or noisy.

Semrush estimates 19 ranking keywords and no measurable organic traffic. That does not mean the site receives zero visits; it means the third-party model cannot detect meaningful volume. The ranking mix shows exactly where to concentrate: protect the real local wins, resolve cannibalization, and stop irrelevant terms from defining the footprint.

Table 1 Priority query read from the current Semrush snapshot

QUERY	POSITION	WHY IT MATTERS	RECOMMENDED MOVE
dermal fillers marlton	6	Best commercial foothold; a page-one service-intent term.	Expand decision support, physician proof, FAQs, internal links, and conversion measurement without diluting the page.
facelift marlton	12	Near page one for the proprietary GT Restore Lift page.	Clarify non-surgical intent, patient fit, treatment pathway, reviewed FAQs, and comparative language.
injectables voorhees	20	Shows local relevance beyond Marlton but needs stronger service-location evidence.	Connect the Voorhees page to specific injectable services and a real Marlton travel/consultation path.
botox marlton	15	High-value local intent lands on a broad regenerative page.	Resolve page targeting and internal-link hierarchy so the dedicated service page owns the query.
cgt aesthetics / cgt medical	28–70	Unrelated or ambiguous terms occupy several URLs.	Audit copy, metadata, anchors, and indexed fragments; keep these collisions from masking the real brand entity.
xeomin toms river	50	Geographically mismatched demand.	Do not chase it. Reinforce the actual Marlton service area and nearby communities.

Source: Semrush Organic Research, US desktop database, viewed Aug. 21, 2026. Positions and volumes are third-party estimates and should be reconciled with Google Search Console after access.

Content architecture

Build around four connected hubs: aesthetic decisions, functional medicine questions, physician expertise, and Marlton-area care. Each hub should have one authoritative parent, supporting answers, and deliberate internal links. Location pages should describe a real service relationship, not swap city names into duplicated copy.

AI systems know GT exists. They do not yet treat it as the answer.

Semrush's six-month AI visibility view reports two mentions, four citations, and three cited pages. ChatGPT and Google AI Mode account for the mentions; Google AI Overviews and Gemini show none. The clearest tracked prompt asks how Vive compares with other Marlton aesthetic clinics. GT appears in the answer, but Vive owns the framing.

14 AI visibility score ESTIMATE	2 Mentions ESTIMATE	4 Citations ESTIMATE	29 Tracked topic opportunities ESTIMATE
--	----------------------------------	-----------------------------------	--

What this means

GT is currently a supporting entity in a competitor-led answer, not the source whose evidence shapes the answer. The work is not “write for ChatGPT.” It is to create fact-dense pages, strong entity links, and independent local citations that answer engines can retrieve, verify, and quote.

Where citations come from now

Semrush surfaced Yelp and other clinic sites among the top sources. That makes off-site corroboration as important as on-site optimization: professional profiles, respected local media, relevant associations, patient-safe evidence, and consistent business data must agree.

1 • Resolve

Resolve the physician and practice entities

2 • Map

Map real patient questions to one canonical answer

3 • Evidence

Add evidence, review, dates, and source links

4 • Distribute

Distribute proof to independent local sources

5 • Re-test

Re-test prompts and improve the weak source

The backlink totals look bigger than the authority they produce.

Semrush and Ahrefs agree on one central point: GT's independent authority is still weak. Their raw linking-domain counts differ because each provider maintains a different index and definition. That divergence is a reason to inspect the links, not average the numbers.

SEMRUSH

2 • Authority Score

518 backlinks and 128 referring domains in the Domain Overview snapshot.

AHREFS PUBLIC CHECKER

0.6 • Domain Rating

509 backlinks, 471 linking websites, and 11% dofollow backlinks. Public checker only; full Site Explorer was not available.

Authority strategy

Earn fewer, better links: physician credential profiles, professional associations, device or treatment partner profiles, local health reporting, chamber and community sources, and original medically reviewed explainers that another publisher can cite. Audit questionable link clusters before considering any disavow action.

Foundation

Unify name, credentials, address, phone, biography, specialties, and sameAs profiles across the site and trusted directories.

Proof assets

Create citable physician explainers, methodology pages, patient-safe case frameworks, treatment comparisons, and local health commentary.

Earned distribution

Pitch specific expertise to South Jersey media, community partners, professional groups, and complementary healthcare publishers.

The foundation is better than the rankings suggest, but the mobile experience is an urgent constraint.

A representative six-template inspection found canonical tags, descriptions, image alt attributes, and JSON-LD on every sampled GT page. The homepage schema is unusually complete for a local practice. The priority issues are semantic heading consistency, template polish, and speed.

29 Mobile performance VERIFIED TEST	16.4s Largest Contentful Paint VERIFIED TEST	1,650ms Total Blocking Time VERIFIED TEST	86 Accessibility score VERIFIED TEST
--	---	--	---

Table 2 Priority technical findings and fixes

FINDING	EVIDENCE	PRIORITY	FIX
Homepage has no H1	Rendered DOM inspection	P0	Promote the primary physician-led value proposition to one descriptive H1 without changing the visual hierarchy.
Blog index has two H1s	Rendered DOM inspection	P1	Keep one page title; demote repeated template headings.
Slow mobile rendering	Lighthouse mobile: LCP 16.4s, FCP 8.5s, TBT 1.65s	P0	Prioritize hero media, remove render-blocking work, delay noncritical scripts, trim plugins, and retest on the same device profile.
Location title quality varies	Voorhees title renders as “Regenerative-Medicine-Voorhees-NJ”	P1	Rewrite for natural service intent, clinic identity, and local relevance.
Schema base is strong	WebSite plus MedicalBusiness / LocalBusiness graph with founder linkage	Protect	Validate on every release; extend with service, breadcrumb, author, review-date, and article relationships where true.
robots.txt automation access blocked	Command-line request returned 403; XML sitemap remained public before rate limiting	Validate	Test Googlebot/Bingbot access in Search Console and server logs. Do not infer crawler blocking from one audit client alone.

Lighthouse is a local mobile lab test from Aug. 21, 2026. Lab scores vary by run and are directional until reconciled with CrUX field data. The run returned a valid report despite a local temporary-folder cleanup warning.

The business case, translated into the questions that move a decision.

This SPIN view is inferred from the proposal context and verified audit evidence, not presented as a call transcript.

Table 3 SPIN decision frame

FRAME	CURRENT TRUTH	QUESTION TO RESOLVE TOGETHER
Situation	GT is a physician-led aesthetic and functional medicine clinic with differentiated expertise and a recently rebuilt digital presence.	Which services, patient profiles, and geographic areas produce the best clinical fit and business value?
Problem	Only 19 estimated keywords, weak independent authority, limited AI mentions, no tracked Google AI Overview presence, and slow mobile delivery.	Where is the current journey losing the most qualified demand: discovery, trust, consultation, or follow-up?
Implication	Competitors frame the comparison before GT’s physician expertise enters the answer. Paid clicks can land on a weak organic and mobile foundation.	What is one qualified consultation worth, and how much invisible demand can the clinic afford to leave unmeasured?
Need-payoff	A connected physician-entity, service, location, evidence, and measurement system creates compounding visibility and makes paid media more accountable.	What would change if the clinic could see which questions, sources, and pages consistently lead to qualified consults?

A connected evidence system makes paid media more accountable.

Repair the signal. Publish the proof. Earn the citation. Iterate.

The sequence matters. Access and measurement come first; technical and entity corrections come before scale; new content ships in evidence-backed clusters; AI monitoring informs the next sprint rather than becoming a vanity dashboard.

1

DAYS 0–14

Instrument and stabilize

- Connect Search Console, GA4, Business Profile, booking, call tracking, and CRM
- Define qualified consultation and service-level conversion events
- Export indexing, queries, landing pages, and local actions
- Fix homepage and blog H1 structure
- Profile mobile script and hero-media cost
- Validate sitemap, canonical, robots, and schema behavior in owned tools
- Create the Dr. Farooqui entity ledger
- Freeze a 30-prompt AI baseline

2

DAYS 15–30

Correct high-intent pages

- Protect and expand dermal fillers Marlton
- Clarify GT Restore Lift versus surgical facelift intent
- Resolve Botox and injectable page ownership
- Rewrite weak location metadata and duplicated sections
- Add physician review, dates, sources, and treatment decision FAQs
- Build Breadcrumb, Service, Article, and Person relationships where valid
- Improve internal links by patient decision stage
- Implement priority mobile performance fixes

3

DAYS 31–60

Build citable authority clusters

- Publish physician-led answers for safety, candidacy, downtime, cost drivers, and alternatives
- Create aesthetic and functional medicine hub pages
- Author comparison pages without competitor disparagement
- Add a clear medical editorial and review policy
- Develop original local commentary and data-led proof assets
- Normalize directory and professional profile data
- Launch targeted local and professional outreach
- Re-test priority prompts and citation sources

4

DAYS 61–90

Compound what earns trust

- Expand only clusters gaining impressions, citations, or qualified engagement
- Refresh answers where AI sources remain competitor-led
- Strengthen pages sitting in positions 6–20
- Close local citation and knowledge-panel inconsistencies
- Review backlink quality and reclaim unlinked mentions
- Connect paid search queries to organic content gaps
- Publish the first outcome and learning report
- Set the next-quarter experiment portfolio

This is a learning system, not a one-time “AI SEO” project.

Every two-week sprint follows the same discipline. The goal is not simply to appear in an answer; it is to become a correct, well-sourced, useful recommendation for the right local patient question.

Observe	Diagnose	Change	Validate	Learn
Prompts, rankings, citations, queries, local actions, leads	Missing entity, weak answer, thin evidence, poor source, bad UX	One controlled page, schema, source, or distribution intervention	Indexing, render, structured data, analytics, answer correctness	Keep, improve, merge, retire, or scale in the next sprint

Prompt set to baseline

1. Best med spa in Marlton NJ
2. Who offers dermal fillers in Marlton?
3. Physician-led aesthetic clinic near Cherry Hill
4. Non-surgical facelift options near Marlton
5. Botox versus Xeomin in South Jersey
6. How to choose a safe injector in New Jersey
7. Functional medicine for gut health near Marlton
8. Functional medicine for inflammation in South Jersey
9. Regenerative aesthetics near Voorhees
10. What should I ask at a filler consultation?
11. How long do dermal fillers last?
12. Who is Dr. Ghazala Farooqui?

Scorecard, by engine and prompt

Brand mentioned correctly; recommended versus merely listed; owned page cited; independent corroborating source cited; physician credentials represented correctly; location and service represented correctly; answer position and competitor set; change from prior two-week sample.

Engines

ChatGPT, Google AI Overviews and AI Mode, Gemini, and Perplexity. Results vary by model, account, geography, and time; trend consistency matters more than a single screenshot.

The first work queue is already clear.

Impact and effort are directional until owned analytics and CMS access confirm the implementation environment.

Table 4 Initial priority queue

PRIORITY	WORKSTREAM	SCOPE
P0	Analytics and lead-definition baseline	Search Console, GA4, GBP, calls, bookings, CRM
P0	Mobile render remediation	Hero media, blocking scripts, plugin payload, retest
P0	Physician and practice entity ledger	Credentials, profiles, sameAs, NAP, service areas
P1	Protect dermal fillers Marlton	Intent depth, reviewed FAQs, links, conversion events
P1	Resolve Botox and location intent	Page ownership, metadata, internal links, unique local proof
P1	Medical editorial and review system	Author, reviewer, dates, sources, update cadence
P2	Local authority and earned-source program	Professional profiles, local media, partnerships, citation assets
P2	AI prompt and citation monitoring	Thirty prompts, five engines, biweekly review

First 30-day definition of done

Owned baselines connected · P0 technical issues addressed · entity ledger approved · three high-intent pages upgraded · AI prompt baseline frozen

We will replace estimates with business outcomes as soon as access is granted.

No honest audit can infer lead quality from a third-party traffic estimate. The first reporting milestone is a shared source-of-truth model that connects discovery to consultation.

Table 5 Source-of-truth access model

SOURCE	WHAT IT ANSWERS	CURRENT STATE	FIRST VALIDATION
Google Search Console	Queries, pages, clicks, impressions, indexation	Pending access	Reconcile Semrush rankings and inspect non-brand demand.
GA4	Landing engagement and key actions	Pending access	Verify consent, event naming, referral exclusions, and form events.
Google Business Profile	Local visibility, calls, directions, website actions	Pending access	Audit categories, services, products, NAP, photos, Q&A, and review velocity.
Booking and call tracking	Consultation intent and channel contribution	Pending access	Define a qualified consultation and deduplicate calls/forms.
CRM or patient intake	Lead quality, service fit, show rate, outcome	Pending access	Map privacy-safe stages and reporting boundaries.
AI prompt monitor	Mentions, recommendations, citations, correctness	Baseline designed	Freeze 30 prompts by engine, location, and intent.

Governance

Medical claims require GT approval. Patient information never enters the content or AI-monitoring workflow. Before-and-after material, testimonials, and treatment comparisons must follow consent, advertising, and platform rules.

Evidence you can inspect. Gaps we will not hide.

This is a pre-engagement snapshot, not a substitute for owned analytics or clinical review.

1. GT Clinic live site: homepage, service, location, blog, metadata, rendered headings, canonical tags, and JSON-LD, reviewed Aug. 21, 2026. thegtclinic.com
2. Semrush: Domain Overview, Organic Research, and AI Visibility, US desktop database, displayed Aug. 20, 2026 and viewed Aug. 21. Third-party estimates, not owned analytics.
3. Ahrefs: free Website Authority Checker viewed Aug. 21, 2026. Public snapshot only; no authenticated Site Explorer project was available.
4. Technical sample: rendered inspection of six representative templates and a local Lighthouse 13.4.1 mobile run on the homepage.
5. Current public search: local result sampling surfaced Vive, Clinical Edge, Marlton Optimal Health, Wildfire Wellness, and other sources. Search results are dynamic and personalized.
6. Call context: Momentum proposal and calendar records. Otter reported it could not record because the notetaker was not admitted; no transcript claims are used here.

Rankings, traffic, AI visibility, backlink counts, and authority metrics differ by provider, index, location, device, and date. No forecast or outcome in this document is a guarantee.

GT CLINIC × MOMENTUM

Make the physician's expertise impossible to miss.
