

How Often Should an Office Be Professionally Cleaned?

A room-by-room method for setting office cleaning frequency without over-servicing or leaving high-use areas behind.

Office cleaning frequency should follow traffic, use, surface type and facility expectations.

Most occupied offices need professional cleaning several times per week, while busy restrooms, entrances, food areas and shared touchpoints may need daily or daytime attention. The right schedule depends on people and use—not square footage alone.

Four factors that set office cleaning frequency

Start with occupancy and traffic. A small appointment-only office behaves differently from a call center with multiple shifts. Then review how each room is used, its surface materials and the standard employees or visitors expect.

Use these questions during planning:

- How many people use the space each day?
- Are food, children, patients or the public present?
- Which areas show soil first?
- Does weather track moisture or grit through the entrance?
- Are there events, hybrid-work peaks or after-hours meetings?

AMI's [office and janitorial service](#) can combine scheduled cleaning with periodic floor, glass and detail work.

A practical starting schedule

Daily or each occupied shift: restrooms, waste, breakroom counters, entrance soil, spills and visibly dirty shared surfaces.

Two to five times per week: occupied workstations, meeting rooms, carpet vacuuming and hard-floor maintenance, adjusted to traffic.

Weekly: low-use offices, detailed dusting, partition glass and edges that routine passes may miss.

Monthly or periodic: high dusting, floor machine work, upholstery attention and restorative services based on material condition.

These are starting points, not universal rules. A facility with a daytime porter may address consumables and spills during business hours, then reserve deeper tasks for a quieter nightly shift.

Clean first; disinfect where the plan requires it

The [CDC explains](#) that regular cleaning removes most germs from surfaces and that visibly dirty surfaces should be cleaned before disinfection. If a disinfectant is used, the label's contact time and safety instructions matter. That is more precise than applying the same product to every surface on every visit.

Facilities that prioritize products with evaluated human-health and environmental criteria can also review the [EPA Safer Choice program](#), while still confirming that each product fits the intended task.

Adjust the plan using inspection data

For the first 30 days, log supply shortages, repeat complaints, entrance soil and rooms that look over- or under-serviced. Move frequency where the evidence points. The best schedule is one the facility can explain, inspect and revise.

If your office spans Delaware, Eastern Maryland or Southeastern Pennsylvania, [schedule a walkthrough with AMI](#) to build a room-by-room service frequency.

Frequently asked questions

Is once-a-week office cleaning enough?

It can be for a very small, low-traffic office, but restrooms, food areas and waste may require more frequent attention. Evaluate each zone separately.

Should an office be cleaned during or after business hours?

Either can work. Daytime service handles spills, supplies and visible needs; after-hours service allows quieter, broader cleaning. Many facilities combine both.

What makes an office need more frequent cleaning?

Higher occupancy, public traffic, shared equipment, food service, seasonal weather, longer operating hours and stricter facility standards.

Walk the building. Then write the plan.

AMI scopes rooms, traffic, access, surfaces and standards before shift one across Delaware, Eastern Maryland and Southeastern Pennsylvania.
