

SmartCare is indexable, visible in search, and now aligned to the new three-tier model.

The production template, public HTML, responsive rendering, crawl controls, metadata, and structured data were verified after publication. The largest remaining opportunity is mobile speed, driven primarily by third-party HubSpot and analytics JavaScript.

Indexability verified

TECHNICAL INDEX SIGNALS

- ✓ Self-referencing canonical URL
- ✓ No page or header noindex directive
- ✓ Allowed by live robots.txt
- ✓ Included in the 124-URL sitemap
- ✓ One H1 and two JSON-LD blocks
- ✓ Current search-result presence confirmed

SMARTCARE CHANGES NOW LIVE

STABILITY & ISSUE TRIAGE

Stabilize

Prioritized action plan and rapid issue resolution.

CONTINUOUS OPTIMIZATION

Optimize

System improvements, reporting, integrations, and adoption.

STRATEGIC PARTNERSHIP

Optimize Plus

Senior roadmap guidance and proactive platform management.

PRIORITIZED OPTIMIZATION QUEUE

PRIORITY 1

Reduce mobile JavaScript cost

Audit HubSpot analytics, banner, collected-forms, and Google tagging. The final lab run showed 2.5s of main-thread work, with third-party scripts dominating CPU time.

PRIORITY 2

Tighten search snippets

Rewrite 12 titles outside the 25–65 character quality band and 20 descriptions outside 70–165 characters. Case studies make up most long-description outliers.

PRIORITY 3

Remove the stale GUID URL

One sitemap URL canonicals to the homepage and creates the only duplicate title/description group. Remove the stale row from HubSpot's sitemap controls.

PRIORITY 4

Clean content-template signals

Correct the duplicate H1 on the HCM vendor selection checklist and validate author markup across the 64 blog URLs flagged by the automated crawl.

SITE-WIDE CRAWL COVERAGE

0 Missing titles

0 Missing descriptions

0 Missing canonicals

0 Missing H1s

0 Missing JSON-LD

0 Missing tracking

Delivered optimizations: three-tier SmartCare redesign; accessible form labels; corrected case-label, footer, and cookie-control contrast; explicit hero-image dimensions; desktop/mobile overflow and console verification.

Measurement note: Lighthouse 13.4.1 lab scores are point-in-time diagnostics, not Search Console field data or revenue attribution.
