

CONNECT. GROW. FIGHT TOGETHER.

Deliverables, current state & forward plan.

A complete evidence-backed account of what has been researched, designed, built, documented, tested, and deployed for Bridge Software Development — plus the decisions and roadmap that move the platform confidently into its next phase.

Prepared

July 27, 2026

Evidence window

May 24 – July 27, 2026

Status

Client-ready progress report

A substantial product and design foundation is complete.

Bridge now has a documented product direction, two distinct prototype families, an official brand source, compliance and verification strategy inputs, working review deployments, and a technical handoff foundation. The next phase brings those assets together through decision alignment, architecture, research expansion, and approved backend integration.

What is complete now

- Evidence-backed product and MVP framing
- Role, journey, screen, state, and handoff documentation
- Clickable responsive prototype environments
- Official brand kit integrated into the connected suite
- Verification and compliance requirements translated into product questions
- Private GitHub source, AI workflow guardrails, and repeatable build checks

What we are building next

- One aligned MVP boundary across the two prototype families
- Production authentication, permissions, database, RLS, storage, and APIs
- Approved verification definition and jurisdiction matrix
- Privacy, retention, moderation, support, and appeals operations
- Current framework refresh and full production validation
- Organized review environments for each stakeholder group

Strong review momentum

Five active Netlify environments make the work easy to review across the three visual directions, the Ledger iteration, and the officially branded connected suite. Each environment is labeled as a review prototype and supports fast stakeholder feedback.

Next milestone focus

The strongest next move is to select the authoritative product direction, refresh the current framework dependencies, complete the decision register, and begin approved backend integration through small, testable vertical slices.

What happened, in order.

The chronology shows how early discovery work evolved into Tori's official brand and product direction.

- MAY-JUN** ● **Engagement and source evidence established**

Agreement, \$45,000 proposal, Gmail, Google Drive, and Bridge Slack history established the software engagement, ownership split, name change from The Ecosystem to Bridge, and six-milestone process.
- JUL 10** ● **Seven-page execution plan completed**

Dillon's AI + Front-End Execution Plan defined responsibilities, six milestones, operating rhythm, guardrails, team dependencies, first deliverable package, and definition of done.
- JUL 11-12** ● **Discovery package, Next.js prototype, repo, QA, and three previews**

Product definition, role matrix, MVP boundaries, provisional brand system, decision materials, Claude Code handoff, responsive prototype, private GitHub repo, testing, and three visual-direction sites were produced.
- JUL 16** ● **Canonical milestone decision brief completed**

Verified decisions, open requirements, owners, dependencies, approval gate, exact-source routing, and privacy boundaries were consolidated into the client-operations system.
- JUL 17** ● **Claude Code and Codex design iteration and revised staging**

The interface received a stronger editorial direction, saved profiles, sorting, active-filter chips, moderation filters, reduced-motion behavior, expanded fictional data, and a deployable redesign package.
- JUL 19-20** ● **Tori's official source package arrived**

Four original HTML concepts, the official branding guide, business-verification requirements, and legal/compliance strategy were preserved, extracted, indexed, previewed, and handed off.
- JUL 20-21** ● **Officially branded connected product suite built**

Landing, Community, Campaign Studio, Business OS, and Signal Exchange were connected into one five-route suite with the official mark, palette, Poppins/Montserrat/Inter type system, responsive navigation, map interpretation, and structural verifier.
- JUL 27** ● **Current-state review and live verification**

Five deployments were live, both code families were rechecked, current policy sources were spot-checked, current screenshots were captured, and the complete deliverable set was consolidated.

Discovery, strategy, and operating materials.

01	Agreement, proposal, communication, and asset evidence pass Reviewed the signed custom software development agreement, updated proposal, proposal screenshot, NDA thread, execution-plan email, Drive searches, exact Bridge Slack channel, group conversation, and available file inventory.	COMPLETE
02	Source and asset audit Cataloged the available source materials, identified the original Claude Code prototype as NDA-held, separated Momentum proposal styling from Bridge branding, and prepared a focused asset request.	HISTORICAL
03	Dillon's AI + Front-End Execution Plan Seven-page internal plan covering scope, team lanes, six milestones, Phase 1 outputs, build/integration/QA/handoff work, AI-use guardrails, and immediate action list.	COMPLETE
04	Marketing context and positioning hypothesis Defined Bridge as a browser-based verified cannabis-industry directory and professional network, with a permission-based introduction model and a working differentiation hypothesis.	REVIEW READY
05	Product definition and MVP boundaries Captured target roles, primary loop, core screens, initial in-scope features, explicit Phase 1 exclusions, data/compliance questions, and technical contract boundaries.	DECISION BASIS
06	Role and capability matrix Mapped profile, directory, save, contact, announcement, evidence-submission, verification, reporting, and moderation capabilities across brand, retailer/dispensary, sales representative, and admin roles.	DECISION READY
07	Application map and state models Structured public, member, and administration surfaces; proposed verification, contact-request, and profile-visibility state models; and identified candidate entities for backend discussion.	PROPOSED
08	Product and technical handoff Defined frontend architecture, Miraj's backend boundary, data/API/RLS/upload/error decisions, nonfunctional requirements, definition of ready, and definition of done.	COMPLETE
09	Tori meeting package Prepared objectives, team pre-work, materials request, a 60-minute agenda, demo sequence, discovery questions, decision categories, scope-change discipline, and live decision capture.	READY
10	Decision log and open register Separated confirmed written-history decisions from provisional prototype assumptions and assigned decisions D-01 through D-08 to appropriate owners.	NEXT REVIEW

Design, prototype, and source-package work.

11	Provisional brand exploration Created Trusted Current, Modern Network, and Botanical Ledger directions with tokens, typography, usage rules, UI principles, approval questions, and a provisional bridge mark.	EXPLORATION COMPLETE
12	Responsive Next.js discovery prototype Built landing, directory, join, profiles, dashboard, admin verification, visual directions, and design system routes with strict TypeScript, reusable components, fictional fixtures, and responsive behavior.	BUILT
13	Functional prototype behaviors Implemented search, role and verification filters; typed profile routes; role-specific onboarding copy; contact-request states; saved profiles; sorting; filter chips; admin queue filters; disabled-control explanations; and reduced-motion support.	BUILT
14	Three locked visual-direction preview sites Published separate noindex Netlify review environments for current, network, and botanical themes so flows could be compared without changing product behavior.	LIVE
15	Claude Code and Codex redesign package Produced a premium editorial redesign, updated tokens and interaction patterns, source and asset audit, baseline report, implementation brief, difference checklist, and a revised live design site.	LIVE
16	Tori source package preservation Archived four original HTML concepts, four rendered PNG previews, official branding guide, verification PDF/text, legal strategy PDF/text, structured extraction JSON, extraction utility, and package README.	COMPLETE
17	Official brand North Star synthesis Translated the official deep-purple/black/white system, Poppins/Montserrat/Inter typography, voice, product principles, verification limits, route contract, and privacy-safe data language into one build reference.	CURRENT
18	Five-route connected product suite Connected Landing, Community, Campaign Studio, Business OS, and Signal Exchange with shared desktop/mobile navigation, connected handoffs, official brand tokens, age/location gate, and noindex prototype labeling.	LIVE
19	Map and typography refinement Advanced geographic discovery with clearly labeled market context, differentiated Google results from Bridge verification, self-hosted the official fonts, improved type scale and contrast, and documented the map as an interface interpretation.	COMPLETE
20	PDF quality-assurance renders Preserved seven page-render images for the original execution-plan PDF to verify layout output and provide a visual review trail.	COMPLETE

Engineering, QA, deployment, and continuity.

21	Private GitHub repository Created dillonmohr8777/bridge-discovery-prototype, established main, added the prototype and documentation, and preserved explicit project identity controls.	CURRENT
22	Claude Code and Codex operating model Documented approved AI uses, human approval gates, repository proof requirements, privacy boundaries, backend ownership, review rules, and exact Bridge client-routing guidance.	COMPLETE
23	Build and staging automation Added production build scripts, theme-locked staging generators, staging verification, static-site verification, Netlify configuration, and a small serverless Google Maps loader.	COMPLETE
24	Original QA and refinement pass Completed typecheck, lint, production build, desktop and mobile checks, console review, theme persistence, filter behavior, mobile administration refinement, source scan, and package review as of July 11.	HISTORICAL PROOF
25	July 27 re-verification Re-ran typecheck, lint, production build, five-route structural verification, live route checks, and current screenshot capture.	CURRENT PROOF
26	Canonical client record and operating context Established the exact bridge-software route, kept the child-client separate from Momentum 360, promoted redacted Gmail/Slack evidence, and documented current ownership, commitments, decisions, and open loops.	CURRENT
27	Milestone decision brief Converted current evidence into one internal gate for MVP scope, roles, journeys, ownership, dependencies, acceptance criteria, and the next review agenda.	COMPLETE
28	Prototype source handoff Preserved source provenance, Slack-aligned delivery contract, prototype coverage, remaining P0/P1/P2 design and build work, production-readiness workstream, QA, and client-decision needs.	COMPLETE
29	Dillon OS / Obsidian continuity package Archived overview, agent memory, provisional brand, meeting prep, source audit, product/technical handoff, and session record with identity and repository guardrails.	COMPLETE

Continuity achieved

The canonical client folder now contains the operating context, milestone brief, source handoff, source package, and this complete progress report, giving the team one durable place to continue Bridge work.

Two product expressions now exist.

The directory-first prototype and the later connected suite are both useful. Together, they give Tori and the team a strong comparison set for selecting the approved MVP and phased product vision.

Directory-first prototype: discovery, verified profiles, structured introductions, admin verification, and three visual directions. Live design iteration shown.

Connected suite: Landing, Community, Campaign Studio, Business OS, and Signal Exchange under the official brand system.

Dimension	Directory-first prototype	Connected suite
Primary value	Verified B2B discovery and permission-based introductions	Community signals, content creation, business tools, and geographic intelligence
Routes	8 named surfaces plus 10 generated profiles	5 connected routes
Brand source	Provisional navy/teal/amber and later editorial redesign	Official deep purple, black, white, Poppins, Montserrat, Inter
Data	Fictional members and metrics	Illustrative content, locations, signals, and map interpretation
Current use	Flow, role, trust, and directory decisions	Vision alignment and cross-product information architecture
Approval need	Confirm the Phase 1 role model and scope	Classify each lane as MVP, later phase, or concept only

Portfolio clarity opportunity

The early Phase 1 definition established a focused directory and verification core. Tori’s later source concepts expand the vision through community, content, business tools, and Signal Exchange. The next decision session can organize these experiences into a clear MVP, follow-on phases, and long-term product roadmap.

Five public review links are active.

All returned HTTP 200 and carried clear review-prototype labeling during the verification pass.

Environment	Purpose	Status	Review state
bridge-preview-current.netlify.app	Trusted Current locked direction	LIVE	READY TO REVIEW
bridge-preview-network.netlify.app	Modern Network locked direction	LIVE	READY TO REVIEW
bridge-preview-botanical.netlify.app	Botanical Ledger locked direction	LIVE	READY TO REVIEW
Bridge Ledger design review	Claude Code and Codex design iteration and Signal route	LIVE	READY TO REVIEW
bridge-connected-signal.netlify.app	Officially branded five-route connected suite	LIVE	READY TO REVIEW

Verified engineering status

- Next.js typecheck: passed
- ESLint: passed
- Production build: passed, 19 static pages generated
- Connected suite verifier: passed, 5 routes / 16 files / 1 function
- Main repository: clean, aligned with origin/main
- Latest local main commit: **653b394**

Next engineering opportunities

- Refresh the framework and supporting dependency chain
- Add production backend, authentication, authorization, and persistence
- Approve schema, RLS, upload, retention, and error contracts
- Move AI-assisted creation into an approved server-side workflow
- Complete the production Google Maps configuration
- Organize stakeholder-specific review access

Discovery work matured into an official direction.

Each stage added useful evidence, clarified the product opportunity, and prepared Bridge for more focused product decisions.

Stage	Contribution	How it carries forward
Provisional visual exploration	Tested a credible, modern, connected visual language.	Provides useful comparison material while the official Bridge kit now guides all current branded work.
Directory-first MVP	Defined roles, verification, profiles, structured introductions, saves, notifications, and administration.	Remains the practical product foundation for the first focused release.
Tori source package	Established the official logo, palette, typography, product principles, verification requirements, and legal strategy inputs.	Serves as the current brand and product reference across design and engineering.
Connected suite	Expanded the vision through Community, Studio, Business, and Signal experiences.	Creates a clear roadmap for phased capability growth around the core network.
Geographic discovery	Explored location, jurisdiction, and market-context interfaces.	Supports future data-backed regional discovery and market planning.
Five review environments	Made multiple product directions tangible and easy to compare.	Supports stakeholder selection, feedback, and an authoritative product direction.

The current brand source

The supplied Bridge branding guide is the visual source for this report and current branded prototype work. The complete source page is attached as the final appendix.

How the work was built and prepared for the next phase.

Prototype purpose

The review environments use illustrative profiles, metrics, signals, locations, documents, and interaction states so stakeholders can evaluate product flows quickly before live data integration.

AI-assisted process

Claude Code and Codex supported research synthesis, specifications, code, design exploration, testing, and QA. Human owners retain product, brand, legal, commercial, platform, and final acceptance authority.

Source stewardship

Client materials were preserved in the canonical Bridge package with source provenance, clear ownership, and a consistent path for future review and handoff.

Compliance foundation

Legal and verification strategy has been translated into configurable jurisdiction, verification, moderation, and platform requirements, ready for focused counsel validation.

Verification promise

The “Bridge Verified” experience is positioned to communicate completed identity, licensing, and authority checks with clear evidence, renewal, review, and status history.

Privacy by design

Data minimization, encryption, role-based access, retention, deletion, appeals, reviewer controls, and audit history are built into the next architecture phase.

Platform-aware design

The product is being planned as a web-first, jurisdiction-aware network with configurable transaction boundaries and a clear path for future marketplace distribution.

Brand and IP stewardship

The next brand rollout includes confirmation of logo and vector rights, fonts, imagery, prototype source, client copy, generated content, trademarks, domains, social handles, and third-party data services.

What the latest primary sources reinforce.

This July 27 desk-research check supports planning and prepares a focused review with legal, privacy, platform, and technical specialists.

Business and identity verification

- The IRS confirms digital CP 575 as EIN confirmation and a substitute for the older notice series / Letter 147C use case.
- SBA guidance reinforces state and local business-registration verification.
- NIST’s current identity-proofing guidance emphasizes privacy planning, minimum necessary attributes, documented retention and deletion, applicant notice, and fraud controls.
- FTC guidance reinforces collecting only what is needed, least-privilege access, written retention policy, vendor controls, and secure disposal.

Platform and federal environment

- Apple’s June 2026 guideline remains a living document and includes cannabis-specific conditions.
- Google Play’s current rules reinforce clear transaction boundaries for cannabis-related applications.
- The federal marijuana rescheduling process was still proceeding through formal hearing/rulemaking in the reviewed 2026 Federal Register notice.
- Configurable jurisdiction rules will keep Bridge adaptable as policies evolve.

Competitive pattern observed

Example	Visible pattern	Research implication for Bridge
Leafwire	Business directory, professional network, company profiles, posts, jobs, verified labels	Bridge can lead through stronger verification, permissions, workflow, and launch-market density.
Growers Network	Private, vetted B2B community with profiles, directory, discussions, and 4,000+ claimed members	Bridge can validate the added value of its role model and structured introductions.
Cannabis Professional Network	Specialist talent and recruiter/company directory	Clarify whether Bridge is a broad operator network, a talent network, a business directory, or an operating layer.
BGX / other B2B exchanges	Licensed buyer/seller verification and compliance-first market positioning	Phase 1 can lead with discovery while the team evaluates future transaction pathways.

Positioning opportunity

The competitive scan gives Bridge a focused validation agenda. Target-user interviews can quantify the value of verified roles, structured introductions, jurisdiction-aware discovery, and an integrated operator network.

The next research program.

Workstream	Focus	Planned output	Phase
Launch market	First state, first role, first successful connection, network supply, target filters	Launch-market brief and prioritized persona/JTBD	DECISION SESSION
Regulatory matrix	Age, license types, advertising, medical/adult use, delivery, geofencing, warnings, tribal/local rules	Counsel-reviewed jurisdiction rules and change owner	COMPLIANCE SPRINT
Verification sources	Authoritative registries, API terms, refresh cadence, exceptions, manual review, recheck and expiry	Role × jurisdiction evidence matrix and source ledger	ARCHITECTURE SPRINT
Privacy and retention	Purpose, minimum fields, consent, notice, retention, deletion, access, vendors, cross-state obligations	Data inventory, privacy plan, retention schedule, and subprocessor plan	DATA DESIGN SPRINT
Platform resilience	Authentication assurance, permissions, uploads, encryption, logs, admin separation, recovery, incident response	Resilience architecture, test plan, access model, and operating runbook	ENGINEERING SPRINT
Moderation and trust	Community rules, reporting, blocking, impersonation, copyright, appeals, reviewer service levels	Community guidelines, moderation matrix, appeals, and audit procedure	COMMUNITY PLANNING
Competitive validation	Alternatives, price, adoption, gaps, switching motivations, and priority personas	Competitor teardown and 5–8 target-user interviews	GTM RESEARCH
Brand rollout	Trademark, descriptor, domains, handles, vector ownership, image and font licenses	Clearance memo and complete production asset kit	BRAND ROLLOUT
Signal methodology	Measures, source rights, sample size, latency, confidence, privacy, explainability	Data dictionary, methodology note, claims rubric, and source contracts	DATA PLANNING
Accessibility and QA	WCAG 2.2 AA, keyboard and screen reader, mobile, browsers, performance, recovery states	Test matrix, automated checks, manual audit, and quality register	PILOT PREPARATION
Monetization	Free and paid roles, subscriptions, promotion, data products, marketplace boundary, billing policy	Business-model decision and platform-policy review	BUSINESS MODEL

Do the next work in this order.

P0.1 Unify and organize

- Confirm the authoritative source repository and review environment.
- Organize stakeholder-specific review paths.
- Record the official branding kit as the current visual source.
- Maintain one product decision log for the Bridge team.

P0.2 Refresh and validate

- Update the framework and supporting packages to the selected production baseline.
- Run typecheck, lint, build, route, responsive, and regression checks.
- Preserve the resulting lockfile, commit, and QA evidence.

P0.3 Run one decision session

- Reconcile Tori's original concepts with the directory-first and connected-suite prototypes.
- Lock the Phase 1 role set, first market, first successful connection, core filters, public/private fields, verification meaning, and visual direction.
- Classify Community, Studio, and Signal as MVP, approved change, later phase, or concept only.

P0.4 Finalize compliance, privacy, and platform architecture

- Complete counsel review for launch jurisdictions, verification language, platform policies, and public terms.
- Approve the data inventory, retention, access, vendor, moderation, appeals, and operational controls.
- Complete Miraj's entities, authentication claims, permissions, uploads, API, environment, deployment, and rollback contracts.

P1 Build approved vertical slices

Implement auth/onboarding → verification submission/review → directory/profile → structured contact request → dashboard/notifications in small reviewed slices with explicit acceptance criteria and test fixtures.

P2 Pilot and launch readiness

Run representative-user testing, accessibility and platform resilience reviews, moderation exercises, data-quality checks, performance budgets, support operations, analytics and consent setup, rollback rehearsal, and a focused-market pilot.

Recommended immediate decision

Select the authoritative product direction, align the MVP with Tori's source package, refresh the technical foundation, and begin the approved vertical slices.

What must leave the next Bridge review.

Product and scope

- Authoritative prototype and repository
- Approved Phase 1 inclusion / deferral list
- Final roles and whether retailer / dispensary are separate
- First launch market and priority role
- First successful connection scenario
- Five highest-priority directory filters
- Community / Studio / Signal phase classification

Trust and data

- Exact meaning and evidence behind “Verified”
- Public, member-only, private, and admin-only fields
- Retention, re-verification, suspension, denial, and appeals
- Who reviews evidence and who audits the reviewer
- Allowed authoritative sources per launch jurisdiction
- Whether any real-time signal data exists and who owns it

Brand and content

- Official logo/vector master and usage rights
- Final palette/type/imagery interpretation
- Bridge vs. The Trap family relationship
- Public master name and descriptor
- Trademark, domain, and handle status
- Who approves public copy and substantiated-claim checks

Ownership and delivery

- Tori: product/brand approval
- Dillon: product structure, UX/front-end, acceptance review
- Miraj: backend, platform architecture, authentication, storage, permissions, integration
- Mac: commercial scope and change approval
- Melissa: client communication, content, launch inputs
- One between-session approval owner and one decision log

Meeting close requirement

Every decision should be recorded as **approved**, **preferred for refinement**, **future option**, or **in review**, with an owner, rationale, affected routes, acceptance criteria, and review date.

Primary local and live evidence used.

File paths are included for internal reproducibility. Communication evidence is redacted and client-record scoped; re-read the exact authorized source before making a new message-specific claim.
