

AI NARRATION SYSTEM / AUGUST 20, 2026

Turn 20+ courses into an audio library.

One polished narrator. A repeatable production system. A hard budget cap with the right scope controls.

\$600

fixed project budget
no recurring client fee

Recommended by

Momentum 360
AI assisted content production

Easy to generate. Expensive to fix badly.

WHAT WE HEARD

The opportunity is to convert more than 20 leadership courses, each roughly 10–30 pages, into useful audio editions. AI makes the narration affordable. The real work is deciding what should be spoken, standardizing the scripts, correcting names and acronyms, and packaging consistent files.

20+

COURSE TITLES

200–600

ESTIMATED SOURCE PAGES

5.5–16.7h

PLANNING AUDIO RANGE*

The volume reality

At a planning assumption of 250 words per page and 150 spoken words per minute, the collection could contain roughly **50,000–150,000 words**. Actual word count, not page count, must control the final scope.

The \$600 reality

The budget works only with **one narrator, clean source files, repeatable formatting, batch rendering, and one consolidated correction round**. A custom performance for every title would exceed the budget.

125K

Recommended narrated-word ceiling. All supplied titles can be included if the spoken text stays at or below 125,000 words after worksheets, tables, citations, quizzes, and repeated page furniture are removed.

One proof. One voice. One controlled batch.

THE LEAN ROUTE

01

Inventory and count

Collect the course files, map titles and sections, count narrative words, and flag tables, worksheets, citations, or image-only content.

02

Approve a 60-second proof

Test three licensed stock voices on the same passage. Approve one voice, tone, pace, and pronunciation direction before bulk generation.

03

Normalize the scripts

Remove non-spoken page furniture, expand important acronyms, mark pauses, standardize headings, and build one pronunciation sheet.

04

Batch-render by section

Generate short, recoverable sections rather than one giant file. This contains errors and makes targeted fixes inexpensive.

05

Quality control

Run duration and file checks, review every opening and ending, listen at accelerated speed, and repair only the flagged sections.

06

Package and hand off

Deliver one master MP3 per course, consistently named section files where headings exist, and a manifest showing title, duration, and status.

ElevenLabs Pro

One month at the current \$99 list price. Paid plans include commercial use; Pro lists 500,000 credits.

Batch efficiency

Flash and Turbo models use 0.5 credits per character on self-serve plans, protecting generation capacity.

Audacity

Free, open-source editing for clean trims, loudness normalization, metadata, and final MP3 export.

Use a stock voice, not a clone.

Voice cloning adds consent, testing, and revision risk. It is not required to create a professional leadership-library experience and is intentionally excluded from the \$600 plan.

Put the money into quality control.

FIXED PROJECT

\$600

ALL-IN PROJECT CAP

The software is the small part of the spend. Most of the budget stays with script preparation, quality control, corrections, and organized delivery.

Licensed narration engine

\$99

One paid production month with commercial-use rights and enough planned capacity for the scoped library.

Intake, cleanup, and batch setup

\$180

Inventory, word count, speech cleanup, pronunciation sheet, file naming, and generation template.

Rendering, QA, corrections, exports

\$251

Batch generation, structured review, targeted repairs, loudness normalization, MP3 packaging, and manifest.

Regeneration and contingency reserve

\$70

Protects the fixed price against difficult pronunciations, corrupted source sections, or limited rerenders.

Included

- All supplied course titles within 125,000 narrated words
- One licensed stock narrator and one 60-second approval proof
- Light speech cleanup without changing the teaching
- Pronunciation support for supplied names and acronyms
- One master MP3 per course plus section files when headings already exist
- One consolidated technical-correction round
- Delivery manifest with filenames, titles, durations, and status

Intentionally excluded

- Custom voice cloning or celebrity-style imitation
- Major rewriting, fact-checking, or instructional redesign
- Music, sound effects, character voices, or dramatization
- Kajabi, WordPress, LMS, Audible, or retailer upload and configuration
- ACX-specific retail mastering, ISBNs, cover art, or distribution
- Unlimited revisions or preference changes after voice approval

Day 1

Files received, counted, and scope confirmed.

Day 2

Voice proof approved; production template locked.

Days 3–10

Batch production, QA, corrections, and delivery.

A small approval gate protects the whole budget.

READY TO BEGIN

RECOMMENDED AUTHORIZATION

Approve the \$600 project after the narrated-word count is confirmed.

Momentum 360 will first validate the files against the 125,000-word ceiling. Once the voice proof is approved, the rest of the library moves through one repeatable production system.

APPROVE FIXED-SCOPE PRODUCTION

1

Course source files

Editable Word, PDF, or exported course text, organized by title.

2

Narration exclusions

Confirm whether worksheets, quizzes, references, and tables should be spoken.

3

Pronunciation list

Names, acronyms, branded frameworks, and any required emphasis.

4

Voice decision

One approver selects the voice, pacing, and tone from the sample.

5

Rights confirmation

Global Leader Solutions confirms it owns or controls the source-text rights.

No surprise-coverage rule

If the narrated text exceeds 125,000 words, the fee stays at \$600. We preserve the cap by removing nonessential spoken material or delivering the highest-priority titles first. Any broader scope requires a new written approval.

Pricing and licensing snapshot, August 20, 2026. ElevenLabs public pricing lists Pro at \$99/month with 500,000 credits; its help center states that paid plans include commercial use when the customer owns the input rights. Its credit guide states that Flash and Turbo models use 0.5 credits per text character on self-serve plans. Audacity describes its editor as free and open source.
