

Momentum Deck System Transfer + Installer

A complete, portable handoff of the editable PowerPoint, motion render, source record, brand assets, and the two skills that produced it.

TRANSFER CONTRACT

Upload this PDF together with the companion ZIP and ask the receiving coding agent to install the package. The ZIP contains the real files. This PDF supplies the install contract, validation rules, and a ready-to-paste instruction.

Built for Claude Code and Codex. Usable as reference context in general ChatGPT work.

One package. No missing pieces.

ITEM	PATH	PURPOSE
Editable presentation	Momentum-Digital-Sales-Deck.pptx	26 slides; native PowerPoint motion; fully editable
Printable presentation	Momentum-Digital-Sales-Deck.pdf	Static review and sharing copy
Self-playing motion	Momentum-Digital-Sales-Deck.mp4	Rendered deck motion for playback and delivery
Build source	deck-project/	Deck script, package lock, brand assets, README, and sources
Skill 1	skills/client-logo/	First-party logo retrieval, cleanup, variants, provenance, and logo motion
Skill 2	skills/client-deck/	Brand system, layout kit, motion canvas, OOXML choreography, PDF/video/QA tools
Reference	documentation/SKILLS-REFERENCE.pdf	Human-readable reference for the two installed skills
Installers	install.ps1 and install.sh	Claude, Codex, or both; backups on forced replacement
Integrity	MANIFEST-SHA256.txt	Per-file checksums for the complete archive payload

Dependency caches and temporary render probes are intentionally excluded. Both skills retain package.json and package-lock.json so dependencies can be rebuilt deterministically for the destination computer.

Restore the system in the target agent.

Windows PowerShell

Expand the ZIP, open PowerShell in the expanded folder, and run one of the following:

```
.\install.ps1 -Target Claude  
.\install.ps1 -Target Codex  
.\install.ps1 -Target Both
```

macOS or Linux

```
chmod +x install.sh  
./install.sh claude  
./install.sh codex  
./install.sh both
```

What the installer does

- Copies client-logo and client-deck into the selected agent's user skill directory.
- Stops on an existing installation unless overwrite is explicitly requested.
- Creates a timestamped backup before any forced replacement.
- Runs npm ci from each pinned package lock unless dependency installation is skipped.
- Checks that each SKILL.md and Momentum brand payload arrived at the destination.

Required runtime

Node.js is required. PowerPoint automation and editable native motion require Microsoft PowerPoint on Windows. Video export and animated logo output require ffmpeg. The core deck and logo workflows can still install when those optional runtimes are absent; the installer reports the missing capability.

General ChatGPT cannot silently write to a local skill directory from a PDF upload. In that environment, the packet acts as source context until a coding workspace or connected filesystem is available.

Give the receiving agent this instruction.

Use Momentum-Digital-Deck-System-Transfer.zip as the installation source and treat this PDF as the transfer contract. Inspect MANIFEST-SHA256.txt, verify the archive payload, and install the bundled client-logo and client-deck skills for the current agent environment. Preserve the exact directory hierarchy and file contents. If an existing skill would be replaced, create a timestamped backup first and report the conflict before forcing replacement. Run the appropriate bundled installer, restore dependencies from each package-lock.json, validate that both SKILL.md files load, validate the Momentum brand JSON and four logo assets, and report the installed paths plus validation results. Do not send email, publish, deploy, spend money, or alter unrelated files. After installation, use the bundled deck project as the reference implementation and keep sources and speaker-note provenance attached to future decks.

Success receipt

Check	Expected result
Skill discovery	client-logo and client-deck are listed by the receiving agent
Brand payload	momentum-digital.json and four Momentum PNG assets are present
Deck tooling	deck-kit.mjs plus choreography, PDF, video, and QA scripts are present
Dependencies	npm ci completes from the two included lockfiles
Integrity	MANIFEST-SHA256.txt matches every payload file
Reference build	the bundled PPTX remains 26 slides with 423 native effects

The PowerPoint remains the editable source of truth; the MP4 is the fixed self-playing presentation.

Portable, inspectable, reversible.

Operating boundaries

- The PDF is an instruction artifact. It cannot execute code by itself.
- The companion ZIP is the complete transfer payload and must accompany the PDF for real installation.
- Install only after the recipient explicitly requests it and the environment permits filesystem changes.
- Keep client data, credentials, publication, spending, and external delivery behind the receiving environment's normal approval rules.
- Before sharing the deck externally, recheck the sign-off items documented in the bundled README and SOURCES files.

The archive's MANIFEST-SHA256.txt is generated after assembly and is the definitive per-file integrity record for this transfer.
